Lessons from Animal Diabetes VI-Eleazar Shafir 2012-12-06 Genic constructs. Five articles are devoted to this topic ranging from the B-cell function in transgenic animals to the various effects on diabetes complications. The section on NIDDM, comprising of 10 articles, deals both with new and existing models, their particular widely varying pathogenesis, genetic characteristics and complications. The animals reviewed include: spontaneously diabetic OLETF rats, Chinese hamsters, Goto-Kakizaki rats, db/db mice, rhesus monkeys, dogs and an article demonstrating the genetic link between the Zucker fa/fa and corpulent cp/cp obese interstrains. We wish to welcome the new members to our Editorial Board, Dr. Hubert Kolb from Dusseldorf, Dr. Alex Rabinovitch from Edmonton, Dr. Takayoshi Toyota from Sendai and Dr. Soroku Yagihashi from Hiroaki. At the same time we would like to thank Dr. Douglas L. Coleman from Bar Harbor and Dr. George Eisenbarth from Denver for their editorial contribution to the previous LAD Vol umes who have retired from the Editorial Board. With great sadness we have to mention Dr. Otho Michaelis IV from Beltsville, MD who suddenly passed away this year. Otho, or Mike as he was called by friends, made a significant contribution in developing and metabolically defining several strains of corpulent cp rats and was extremely helpful in the editorial work of the LAD series. His contribution will remain in a lasting memory of all researchers of animal diabetes.

Human Insulin-D.R. Owens 2012-12-06 Since insulin became available for the treatment of diabetes in 1922 a number of major advances have been made, which include the modification of insulin to vary its timing of action, its purification, and latterly, the production of human insulin. Human insulin in quantities sufficiently large for therapy has been made available by two techniques developed in parallel during the late 1970s. These involve either (i) formulation in E. coli bacteria suitably encoded by DNA recombinant methods of the A- and B-chains of human insulin followed by a chain combination reaction ('biosynthetic' human insulin) or (ii) enzymatic conversion (transpeptidation) of porcine insulin brought to react with a threonine ester by porcine trypsin in a mixture of water and organic solvents, yielding human insulin ('semi-synthetic' human insulin). This book includes the first clinical-pharmacological studies of each of the highly purified 'semi-synthetic' human insulin preparations: Actrapid® HM; Monotard® HM; Protaphane® HM; Actraphane® HM; and Ultratard® HM (Novo Industri A/S, Copenhagen). The preliminary studies established their safety and efficacy relative to their porcine and bovine counterparts emphasising the relevance of species and formulation on the pharmacokinetics and biological responses to insulin. Additional investigations with human insulin demonstrated the influence of insulin concentration, the addition of aprotinin to insulin and the mixing of 'short-' and 'intermediate-acting' formulations on insulin 'bioavailability'. Examination of the 'within' and 'between' subject day-to-day variation in absorption and the effect of subcutaneous insulin also demonstrates the dominating influence of insulin responsiveness.

Your Guide to Diabetes: Type 1 and Type 2-U. S. Department of Health and Human Services 2012-07-11 The National Institutes of Health Publication 09-4016, "Your Guide to Diabetes: Type 1 and Type 2," addresses diabetes and how you can learn how to take care of your diabetes and how to prevent some of the serious problems that diabetes can cause. You may want to share this booklet with your family and friends so they too will understand more about diabetes and how they can help you live a healthy life. And remember, you can always ask your health care team any questions you might have. Diabetes means your blood glucose, also called blood sugar, is too high. Your blood always has some glucose in it because your body needs glucose for energy to keep you going. But too much glucose in the blood isn't good for your health. Glucose comes from the food you eat and is also made in your liver and muscles. Your blood carries the glucose to all the cells in your body. Insulin is a chemical, also called a hormone, made by the pancreas. The pancreas releases insulin into the blood. Insulin helps the glucose from food get into your cells. If your body doesn't make enough insulin, or if the insulin doesn't work the way it should, glucose can't get into your cells. It stays in your blood instead. Your blood glucose level then gets too high, causing prediabetes or diabetes. This book will help you to learn the things you can do each day and during each year to stay healthy and prevent diabetes problems.

Ultimate Guide for Type 2 Diabetes Reversal Deluxe Edition-Cheng Ruan, M.D. 2016-10-08 A full color recipe book with an easy to follow Type 2 Diabetes reversal and Prediabetes reversal eating plan developed by Dr. Cheng Ruan, MD and Mimi Chan, RD LD CNSC CDE. This program is not designed to be a temporary diet. It is designed for someone with Type 2 Diabetes (or prediabetes) to learn a system of eating where you can have permanent success. Learning what foods can work for you by understanding how it affects your body is the foundation to establish permanency in behavioral changes. Rather than telling you a detailed system of what to eat and the quantity, we have devised a way where it's easier. Three of the six layers of foods are unlimited. In fact, there are minimum quantities to eat daily. For those who have poorly controlled diabetes, we created a sliding scale eating system. Depending on what their blood sugars are that morning, they utilize different portions or different partitions of each of the categories of food. That will likely impact the next morning's blood sugar which hopefully will become lower by the way you eat the day before. And the lower your blood sugar becomes, the more you're allowed to have cheat meals. It becomes a reward system that's designed for success. They are rewarded by lower blood sugars and more cheat meals if they keep the blood sugars low. But if the blood sugars become higher the next morning, some elements of the program are restricted. Surprisingly, what we've noticed is that people do not opt for the cheat meals anymore because their reward, instead of being food, becomes the lowered blood sugar results. Therefore, since they don't want their blood sugars to go up again, they naturally avoid cheat meals. Following this plan, most have succeeded in fat loss (even without exercise), lowered triglycerides, lowered Hemoglobin A1C, and improved energy and vitality! This book was created with the focus of humans in mind. Humans, from the time we wake to the time we go to sleep, seek reward every second we are awake. Whenever we seek reward, we tend to take it from wherever we can get it. Throughout modern times, a reward became food. As food became readily available, we transitioned to seek food that are rich in sugar and processed sugar. When processed sugars became cheaply made and easily available worldwide, the epidemic of Diabetes began. As humans, we cognitively understand what we need but we still feed into our instincts and desires. We understand there are things that are healthy and unhealthy for us. Yet, more often than not, we continue to make choices that are deemed bad. Why is that? Why do we keep making these choices if we understand that whatever we're doing can be damaging to our body? Why do smokers continue to smoke, knowing that it is a major contributor of heart disease and strokes? Why do diabetics continue to eat sugary and high carb foods when they understand that it will raise their blood sugars, ultimately leading to organ damage and cardiovascular disease? Why is it that we behave in such ways that may be detrimental to our health? The short answer is that it's just something humans do. Humans seek reward and this reward system can be so strong that, cognitively, we may not be able to bypass it. The reward system is so strong it can become habitual behavior. Habits by definition are automatic, emotionless things that we do not think about when we act. Through certain formed habits, we feed into our body's deterioration. It's through these habits that we continue to suppress our own lifelong goals because of this one defining attribute. We, humans, are addicted to instant reward and gratification. The eating plan detailed in this book is to work WITH human nature rather than against it. That is why there is no carb counting, calorie counting, or any math involved. Eat the categories of foods that will keep your blood sugars down, your fat down, and your spirits up. Enjoy the delicious recipes that we have created in our own kitchens!
